

Continuous Authorization Management

Mitigating identity-based risk across your hybrid environment

Why Authomize?

- ✓ Continuous Monitoring and Enforcement
- ✓ Cross Environment (SaaS, IaaS, Data and On-Prem)
- ✓ One-Click Integration
- ✓ Prescriptive Intelligent Automation
- ✓ Real-time Alerting on policy violations
- ✓ Centralized Full stack IAM Platform

“Okta has clearly solved the user authentication problem that enables enterprises to easily access cloud applications. Authomize is solving the next problem managing the authorization privileges of end users after they've been granted application access.”

Mark Settle,
Former CIO of Okta

Meet Authomize

Authomize is the first automated authorization security management platform. We enable organizations to mitigate IAM risk by providing deep observability and centralized, granular control over their identity and asset access policies across all their cloud environments (IaaS, SaaS, Data).

Starting with one-click SaaS deployment, Authomize creates a detailed map of all identities, accounts, assets, access policies, authorizations, user actions, and the relationships between them. This enables continuous monitoring of security policies and automated remediation of violations to ensure business continuity and compliance.

Machine Learning algorithms provide human-readable, actionable prescriptive recommendations for how to improve your security posture based on a deep understanding of not only which identities have access to which assets, but also how that access is being used down to the most granular level.

Top Use Cases

Streamlining Access Reviews

Enforcing Security Policies and Best Practices

Identifying Externally Exposed Assets

Securely Managing the JML Lifecycle

Implementing a Zero Trust Architecture

Continuous Authorization Security

We play well with others

Authomize has one-click integration for fast deployment. We offer out-of-the-box connectors with all major platforms and an OpenAPI framework to connect homegrown and legacy apps.
